

## Your gateway to better parking practices

The operations of the smart scanning system of paid public parking have now begun in Dubai. It involves the use of digital cameras powered by artificial intelligence and machine learning technologies.

The smart parking control unit can monitor and read number plates of vehicles in all directions (360°) regardless of the type of parking space – thanks to 20 digital cameras fitted on all sides of the vehicle.

These cameras can read and analyze vehicle plates at the public parking at a speed of more than 80 km/h with an accuracy of more than 99%.
